

CHEMICALS FOR PULP & PAPER PROCESS

PRODUCT INFORMATION

KURITA KL-608

APPLICATION

KURITA KL-608 is a low to medium viscous, highly effective silicone antifoam emulsion, especially for the use in pulp mills.

FEATURE

- Excellent knock down efficiency
- Very good long term efficiency
- Complies to different FDA-paragraphs and BfR recommendation
- **KURITA KL-608** act primarily as an antifoam agent and drainage aid and may be added at various stages during the manufacturing process.
- **KURITA KL-608** is mainly applied to pulp-washing and screening processes, but it also effective during bleaching and in waste water treatment.

HOW TO USE

The emulsion should be added undiluted, as it is already sufficiently dispersed by its emulsion form. If a pre-dilution still should be necessary, we recommended with cold water in proportions of 3 parts emulsion: 1 parts of water to max. 1 part emulsion: 1 part of water. Sufficient quality of this pre-dilution should be checked by previous trials in laboratory scale. For manufacture of the pre-dilution add first the emulsion and then add the water under weak stirring. The ready-made dilution has to be agitated 2 to 3 times a day for 15 to 20 min by weak stirring and should be processed within few days. For more detailed information about the handling and storage of **KURITA KL-608** emulsion please see our brochure **KURITA KL-608** solution for the unique demands of pulping.

PROPERTIES

1. Main ingredient : Silicone based
2. Appearance : Milky white
3. pH (25°C) : 5 – 8
4. Viscosity (25°C) : 1000 – 3000 mPa's

HANDLING AND STORAGE

- Protect the face and hands with mask and gloves.
- Wash the affected area thoroughly with water in the case of contact the exposure skin.
- Do not use the empty containers for drinking water supply.

PACKAGING

NET 950 kgs in container

P.T. KURITA INDONESIA

Jl. Jababeka XII A Kav. V-6 Kawasan Industri Jababeka
